EE24BTECH11019 - DWARAK A

Question:

Find a relation between x and y such that the point (x, y) is equidistant from the point $(3, 6)$ and $(-3, 4)$.

Solution:

Variable	Description	Value
A	First point	$\begin{pmatrix} 3 \\ 6 \end{pmatrix}$
B	Second point	$\begin{pmatrix} -3 \\ 4 \end{pmatrix}$
C	Mid-point of A and B	$\begin{pmatrix} \frac{A+B}{2} \end{pmatrix}$
X	Set of points equidistant from A and B	$\begin{pmatrix} x \\ y \end{pmatrix}$

TABLE 0: Variables Used

If **X** is equidistant from the points **A** and **B**

$$\|A - X\| = \|B - X\| \quad (0.1)$$

$$\|A - X\|^2 = \|B - X\|^2 \quad (0.2)$$

$$\|A\|^2 - 2A^T X + \|X\|^2 = \|B\|^2 - 2B^T X + \|X\|^2 \quad (0.3)$$

$$(A - B)^T X = \frac{\|A\|^2 - \|B\|^2}{2} \quad (0.4)$$

The above equation is the general expression for the perpendicular bisecting plane between any points **A** and **B**.

Substituting the **A** and **B** values in the derived equation.

$$\begin{pmatrix} 6 \\ 2 \end{pmatrix}^T X = \frac{\left\| \begin{pmatrix} 3 \\ 6 \end{pmatrix} \right\|^2 - \left\| \begin{pmatrix} -3 \\ 4 \end{pmatrix} \right\|^2}{2} = \frac{20}{2} = 10 \quad (0.5)$$

Comparing with $n^T x = c$

$$n = \begin{pmatrix} 6 \\ 2 \end{pmatrix} \quad (0.6)$$

$$c = 10 \quad (0.7)$$

Line equation :

$$6x + 2y = 10 \quad (0.8)$$

Final line equation :

$$3x + y = 5 \quad (0.9)$$
